# La cerca d'informació en salut: Raó de ser

“El significat del saber ha canviat de ser capaç de recordar i repetir informació a ser capaç de trobar-la i utilitzar-la”

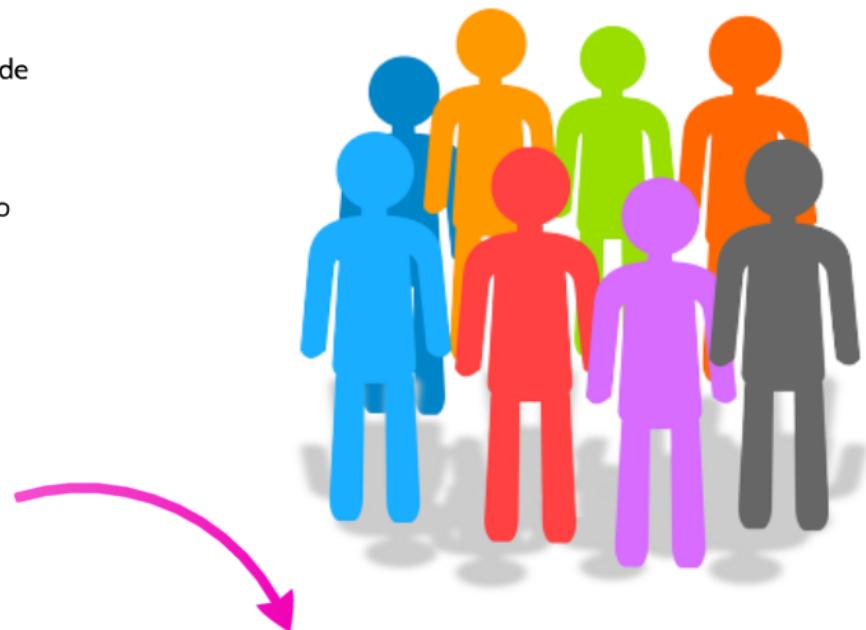

Herbert Simon-(Premi Nobel d'Economia el 1978)

“No necessito saber-ho tot. Només necessito saber on trobar el que em faci falta, quan ho necessiti”.

Albert Einstein

*La gestió del coneixement dins de les institucions sanitàries és una necessitat per tal que els i les professionals disposin de fonts adequades i actualitzades d'informació que garanteixin la presa de decisions basades en l'evidència, i això els permeti millorar la qualitat de la seva tasca assistencial, docent, investigadora i de gestió sanitària.*

*ORDRE SLT/506/2009, de 18 de novembre, per la qual es crea el Programa per al desenvolupament de la Biblioteca de Ciències de la Salut.*

La **MBE** es defineix com l'ús conscient i explícit de les millors i més actuals evidències (fets provats) per a la presa de decisions clíniques sobre la cura dels pacients. Aquesta es diferencia netament de la pràctica clínica basada en la tradició i experiència ocasional, sovint plegada d'errors sistemàtics.

IMPRESCINDIBLE: coneixements mèdics i experiència clínica.

La **MBE** es defineix com l'ús conscient i explícit de les millors i més actuals evidències (fets provats) per a la presa de decisions clíniques sobre la cura dels pacients. Aquesta es diferencia netament de la pràctica clínica basada en la tradició i experiència ocasional, sovint plegada d'errors sistemàtics.

**IMPRESCINDIBLE:** coneixements mèdics i experiència clínica.

## Limits / Filtres

combina les paraules amb  
**AND OR NOT**

## Mesures de prevenció de l'accident cerebrovascular en pacients amb agents anticoagulants per a fibril·lació auricular.

1

conceptes clau:

- Accident cerebrovascular / prevenció
- fibril·lació auricular
- agents anticoagulants

2

paraules clau:

- stroke, cerebrovascular accident, cerebrovascular accidents...
- atrial fibrillation, auricular fibrillation, AF
- anticoagulants, anticoagulant agents, noms dels agents...

3

combinació dels termes mitjançant operadors booleans.

## OPERADORS BOOLEANS : per combinar termes

**AND** – recupera articles /cites que continguin tots els termes

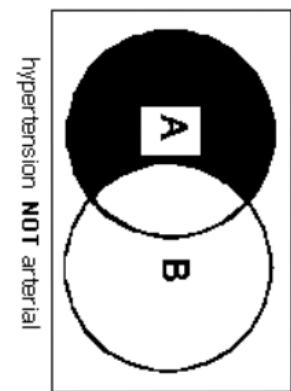

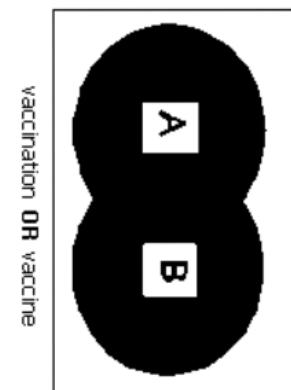

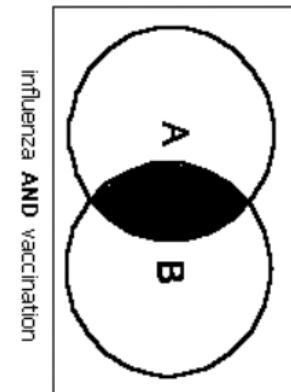

Ex.: stroke AND anticoagulant\*

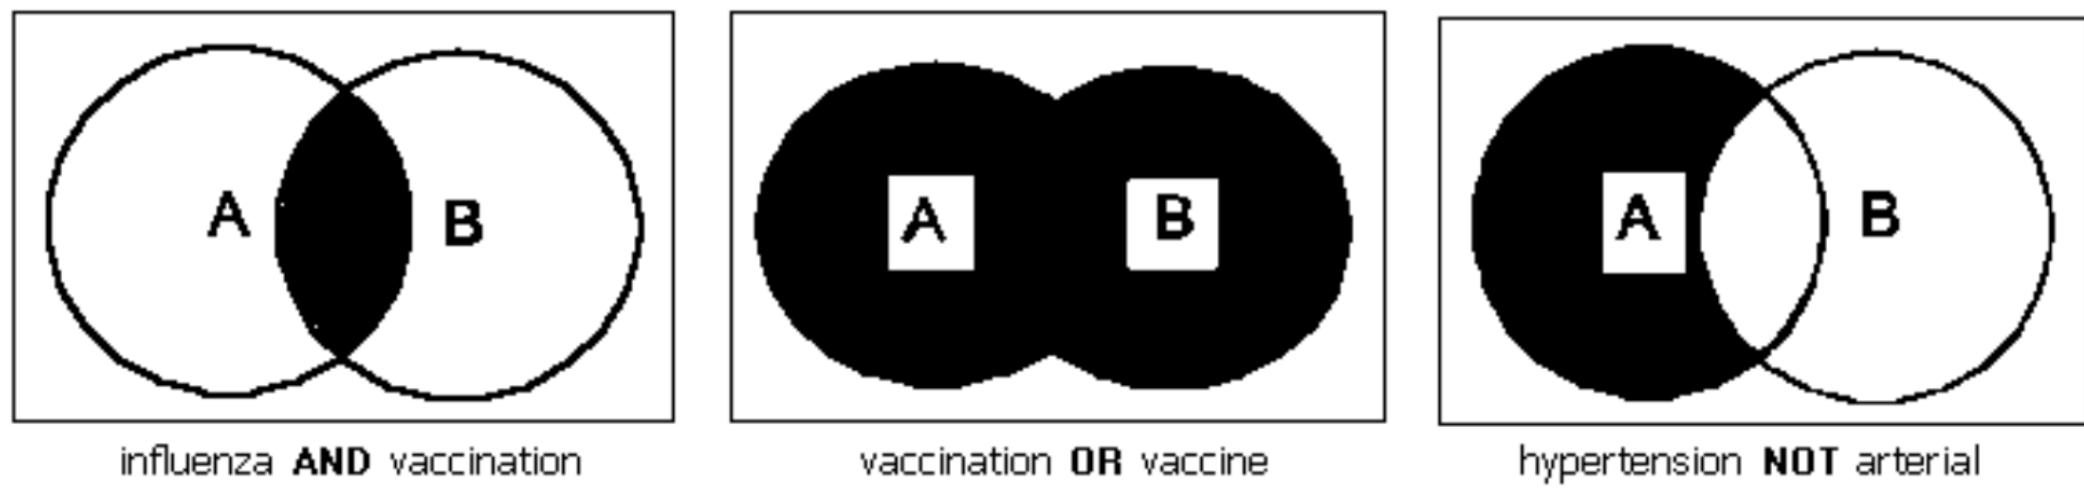

**OR** – recupera articles/cites que continguin almenys un dels termes, sovint han d'anar tancats entre parèntesis abans d'ajuntar-ho a la resta de termes. Sinònims!

Ex.: (stroke OR "cerebrovascular accident")

**NOT** – exclou les cites que continguin el terme precedit de NOT

Ex.: drugs NOT antibiotics

PubMed és la base de dades bibliogràfica de la National Library of Medicine dels Estats Units. Permet l'accés gratuït a bases de dades compilades per la NLM: MEDLINE, PreMEDLINE (cites recents enviades pels editors), Genbak i Complete Genoma.

MEDLINE és la principal base de dades de la NLM i abarca els camps de la biomedicina i salut que engloba també parts de ciències de la vida, ciències del comportament, ciències químiques i bioenginyeria.

Actualment inclou més de 24 milions de registres d'articles biomèdics des de l'any 1947 fins a l'actualitat que provenen de 5.600 revistes de tot el món.

# MeSH

Mesh és un vocabulari controlat de termes biomèdics (actualitzat anualment) que identifica el contingut de cada article. L'ús del Mesh dóna consistència i uniformitat a la base de dades. El Mesh a més a més de ser utilitzat per la indexació dels articles també pot ser utilitzat per construir cerques.

### Stroke

1. A group of pathological conditions characterized by sudden, non-convulsive loss of neurological function due to BRAIN ISCHEMIA or INTRACRANIAL HEMORRHAGES. **Stroke** is classified by the type of tissue NECROSIS, such as the anatomic location, vasculature involved, etiology, age of the affected individual, and hemorrhagic vs. non-hemorrhagic nature. (From Adams et al., Principles of Neurology, 6th ed, pp777-810)

Year introduced: 2008 (2000)

### Stroke, Lacunar

2. **Stroke** caused by lacunar infarction or other small vessel diseases of the brain. It features hemiparesis (see PARESIS), hemisensory, or hemisensory motor loss.

Year introduced: 2012

### National Institute of Neurological Disorders and Stroke

3. Component of the NATIONAL INSTITUTES OF HEALTH. It supports and conducts research, both basic and clinical, on the normal and diseases nervous system. It was established in 1950.

Year introduced: 2009

### Heat Stroke

4. A condition caused by the failure of body to dissipate heat in an excessively hot environment or during PHYSICAL EXERTION in a hot environment. Contrast to HEAT EXHAUSTION, the body temperature in heat **stroke** patient is dangerously high with red, hot skin accompanied by DELUSIONS; CONVULSIONS; or COMA. It can be a life-threatening emergency and is most common in infants and the elderly.

Year introduced: 1996

### Stroke Volume

5. The amount of BLOOD pumped out of the HEART per beat, not to be confused with cardiac output (volume/time). It is calculated as the difference between the end-diastolic volume and the end-systolic volume.

Year introduced: 1986(1979)

### MELAS Syndrome

6. A mitochondrial disorder characterized by focal or generalized seizures, episodes of transient or persistent neurologic dysfunction resembling strokes, and ragged-red fibers on muscle biopsy. Affected individuals tend to be normal at birth through early childhood, then experience growth failure, episodic vomiting, and recurrent cerebral insults resulting in visual loss and hemiparesis. The cortical lesions tend to occur in the parietal and occipital lobes and are not associated with vascular occlusion. VASCULAR HEADACHE is frequently associated and the disorder tends to be familial. (From Joynt, Clinical Neurology, 1992, Ch56, p117)

Year introduced: 1993

## Atrial Fibrillation

Abnormal cardiac rhythm that is characterized by rapid, uncoordinated firing of electrical impulses in the upper chambers of the heart (HEART ATRIA). In such case, blood cannot be effectively pumped into the lower chambers of the heart (HEART VENTRICLES). It is caused by abnormal impulse generation.

Year introduced: 1984

# Visualització de resultats

The screenshot shows a search results page from PubMed. The search term entered is "Atrial Fibrillation"[Mesh] OR ((atrial[ti] OR auricular[ti]) AND fibrillation\*[ti]). The results are displayed in a grid format with 100 items per page, sorted by Most Recent. The first result is a meta-analysis titled "The CHADS<sub>2</sub> and CHA<sub>2</sub>DS<sub>2</sub>-VASC scores for predicting ischemic stroke among East Asian patients with atrial fibrillation: A systematic review and meta-analysis." by Xiong Q<sup>1</sup>, Chen S<sup>2</sup>, Senoo K<sup>3</sup>, Proietti M<sup>4</sup>, Hong K<sup>2</sup>, Lip GY<sup>5</sup>. The page includes filters on the left for Article types, Text availability, and other search parameters, and a sidebar on the right for filtering results by category like All (1945), Clinical Trial (242), and Core Clinical Journals (442).

## Stroke prevention in atrial fibrillation: a systematic review.

Lip GY<sup>1</sup>, Lane DA<sup>2</sup>.

### Author information

#### Abstract

**IMPORTANCE:** Atrial fibrillation (AF) is associated with an increase in mortality and morbidity, with a substantial increase in stroke and systemic thromboembolism. Strokes related to AF are associated with higher mortality, greater disability, longer hospital stays, and lower chance of being discharged home than strokes unrelated to AF.

**OBJECTIVE:** To provide an overview of current concepts and recent developments in stroke prevention in AF, with suggestions for practical management.

**EVIDENCE REVIEW:** A comprehensive structured literature search was performed using MEDLINE for studies published through March 11, 2015, that reported on AF and stroke, bleeding risk factors, and stroke prevention.

**FINDINGS:** The risk of stroke in AF is reduced by anticoagulant therapy. Thromboprophylaxis can be obtained with vitamin K antagonists (VKA, eg, warfarin) or a non-VKA oral anticoagulant (NOAC). Major guidelines emphasize the important role of oral anticoagulation (OAC) for effective stroke prevention in AF. Initially, clinicians should identify low-risk AF patients who do not require antithrombotic therapy (ie, CHA2DS2-VASc score, 0 for men; 1 for women). Subsequently, patients with at least 1 stroke risk factor (except when the only risk is being a woman) should be offered OAC. A patient's individual risk of bleeding from antithrombotic therapy should be assessed, and modifiable risk factors for bleeding should be addressed (blood pressure control, discontinuing unnecessary medications such as aspirin or nonsteroidal anti-inflammatory drugs). The international normalized ratio should be tightly controlled for patients receiving VKAs.

**CONCLUSIONS AND RELEVANCE:** Stroke prevention is central to the management of AF, irrespective of a rate or rhythm control strategy. Following the initial focus on identifying low-risk patients, all others with 1 or more stroke risk factors should be offered OAC.

PMID: 25988464 [PubMed - indexed for MEDLINE]

# Síntesis / Revisions sistemàtiques

Les Revisions sistemàtiques sintetitzen / recopilen l'evidència disponible sobre un tema procedent de les investigacions primàries. Aquests estudis són identificats sistemàticament, avaluats críticament i presenta una síntesi de les dades obtingudes i conclusió dels resultats.

Les Metaanàlisis fan, a més a més, una síntesi estadística dels resultats de dos o més estudis.

## Bases de dades útils per a recuperar revisions sistemàtiques:

- Pubmed / Embase / Cinahl , etc. : limitant els resultats a revisions sistemàtiques o metaanàlisis
- Cochrane Library / Cochrane Library Plus
- Database of Abstracts of Reviews of Effectiveness (DARE)

June 2015  
Volume 20  
Issue 3

Evidence-Based Medicine systematically searches a wide range of international medical journals applying strict criteria for the validity of research. Experts critically appraise the validity of the most clinically relevant articles and summarize them including commentary on their clinical applicability. EBM also publishes articles relevant to the study and practice of evidence-based medicine.

## Randomised control trial

## Using the Watchman device to close the left atrial appendage reduces risk of stroke in atrial fibrillation, compared to using warfarin

10.1136/ebmed-2014-110154

Martin J Swaans, Arash Alipour, Lucas V Boersma

Department of Cardiology, St Antonius Hospital, Nieuwegein, The Netherlands

Correspondence to: Dr Martin Swaans, Department of Cardiology, St Antonius Hospital, Koekoekslaan 1, 3435 CM Nieuwegein, The Netherlands; m.swaans@antoniusziekenhuis.nl

**Commentary to:** Reddy VY, Sievert H, Halperin J, et al.; PROTECT AF Steering Committee and Investigators. Percutaneous left atrial appendage closure vs warfarin for atrial fibrillation: a randomized clinical trial. *JAMA* 2014;312:1988–98.

### Context

Atrial fibrillation (AF) is a common arrhythmia in clinical practice. The major complication of AF is thromboembolic stroke. Patients with AF have a fivefold higher risk of stroke and a twofold increase in mortality.<sup>1</sup> As complete cure for AF is never certain, the aims of AF therapy are symptom relief and prevention of thromboembolic events. The latter can be managed by vitamin-K-antagonists (VKA), but is accompanied by several disadvantages including increased risk of bleeding and the need for monitoring with regular lab work. New oral anticoagulants (NOAC) regimens are simpler but are still associated with bleeding risk.

These problems, added by the fact that the majority of thrombi originate from the left atrial appendage (LAA), have led to the strategy of mechanically sealing the LAA with the Watchman device to prevent thromboembolic events by excluding it from the systemic circulation.<sup>2</sup>

were fewer fatal or disabling strokes in the LAA-closure group. Secondary analysis also showed superiority in all-cause mortality (3.2%, (95% CI 2.5 to 4.2%) vs 4.8%, (95% CI 3.6 to 6.4%), which is a 34% RRR and 60% RRR in cardiovascular mortality (1%, (95% CI 0.6 to 1.5%) vs 2.4%, (95% CI 1.4 to 3.4%)). Causes of death were balanced between the groups, but those treated with warfarin were more likely to die from haemorrhagic stroke.

### Commentary

The most intriguing finding of this study is that the direct positive effect of LAA-closure was driven by fewer haemorrhagic and cardiovascular deaths, while rates of ischaemic stroke in LAA-closure (1.4%, (95% CI 0.9 to 2.1%)) and warfarin patients (1.1%, (95% CI 0.5 to 1.7%)) did not differ; a surprising finding since the procedure was performed to prevent thromboembolic strokes. Apparently, other causes such as carotid/aortic atherosclerotic disease may still be substantial contributors. We postulate that LAA-closure-related thrombus formation and incomplete sealing, especially in the first months after implant may also cause thromboembolic strokes.

From safety point of view the long-term follow-up data show that although warfarin had a clear advantage with regard to the primary safety end point early after LAA-closure, at mean 3.8 years the difference in the number of events had equalised between the groups. With progress in operator's learning curve, one might expect that safety profile (catheter/device-related complications) may improve as shown in the Continued Access Protocol (CAP) Registry.<sup>4</sup>

### Implications for practice

Long-term efficacy from this study and safety results of CAP and PREVAIL provide evidence that LAA-closure is a viable alternative to warfarin for stroke reduction in non-valvular AF.<sup>4,5</sup> Our expectation is that the data on preventing ischaemic strokes would improve after better patient selection, especially excluding those with severe atherosclerosis in the carotid arteries/aorta. Improving safety by increased operator experience may improve the results for the LAA-closure. A future trial should be designed to compare LAA-closure versus NOAC.

**Competing interests** The Cardiology Department of St Antonius Hospital receives proctoring fees for training/educational services from Atritech/Boston Scientific.

All topics are updated as new evidence becomes available and our [peer review process](#) is complete.

Literature review current through: May 2015. | This topic last updated: Mar 20, 2015.

**INTRODUCTION** — Development and subsequent embolization of atrial thrombi can occur with any form (ie, paroxysmal, persistent, or permanent) of atrial fibrillation (AF). (See "Overview of atrial fibrillation", section on 'General classification'.) While ischemic stroke is the most frequent clinical manifestation of embolization associated with AF, embolization to other locations in the systemic and pulmonary circulations also occurs, but is less commonly recognized. (See "Stroke in patients with atrial fibrillation".)

As a result of embolic risk, chronic oral anticoagulation is recommended for most AF patients. However, such therapy is associated with an increased risk of bleeding and recommendations for its use must take both benefit and risk into account.

Anticoagulant therapy for the prevention of embolic events in patients with AF will be reviewed here. Other related topics include:

- (See "[Prevention of embolization prior to and after restoration of sinus rhythm in atrial fibrillation](#)".)
- (See "[Stroke in patients with atrial fibrillation](#)".)
- (See "[Mechanisms of thrombogenesis in atrial fibrillation](#)".)
- (See "[Nonpharmacologic therapy to prevent embolization in patients with atrial fibrillation](#)".)

**PATIENTS WITH VALVULAR HEART DISEASE** — Many [1-10], but not all [11], of the major clinical trials of antithrombotic therapy and subsequent meta-analyses have excluded patients with any type of prosthetic heart valves, those with mitral stenosis, and those with decompensated valvular heart disease who were likely to require valve replacement in the near future. Based on these studies, the newer anticoagulants should not be prescribed for these patients. Anticoagulation in these patients is discussed separately. (See "Antithrombotic therapy in patients with prosthetic heart valves" and "Medical management and indications for intervention for mitral stenosis", section on 'Prevention of thromboembolism'.)

Some patients with valvular lesions (without heart failure) such as mitral valve prolapse, non-rheumatic moderate mitral regurgitation, or moderate or less aortic valvular conditions have been enrolled in the clinical trials of the newer anticoagulants. These trials also likely included a few patients (with or without heart failure) with severe valvular lesions who were not scheduled to undergo valve replacement. Until further evidence is available, we believe these newer drugs should be considered for these patients.

**IMPACT OF ANTICOAGULATION** — Many antithrombotic (anticoagulant and antiplatelet) strategies have been evaluated in clinical trials. These trials [1-7] and their meta-analyses [8-10] have demonstrated that among patients with atrial fibrillation (AF) at **moderate to high risk** of thromboembolic events (CHA<sub>2</sub>DS<sub>2</sub>-VASc risk stratification score ≥2), [warfarin](#) significantly reduces the incidence of clinical stroke at an acceptable risk of bleeding compared to placebo. The benefit to risk ratio from oral anticoagulation in patients at **very low** (CHA<sub>2</sub>DS<sub>2</sub>-VASc score of 0) and **low risk** (CHA<sub>2</sub>DS<sub>2</sub>-VASc score of 1) has not been well studied ([table 1](#)). After discussing the benefits and risks with the patient, we anticoagulate some patients with the former and many patients with the latter.

**Reduction in stroke risk** — Anticoagulation reduces the risk of ischemic stroke (and other embolic events) by about two-thirds irrespective of baseline risk. In one contemporary study, the annual risk of ischemic stroke in untreated patients was 0.2, 0.6, and 2.2 for those with CHA<sub>2</sub>DS<sub>2</sub>-VASc scores of 0, 1, and 2 [12].

The SPAF-I, SPAF-II, and SPAF-III trials, and AFASAK, BAATAF, SPINAF, and CAFA randomly assigned more than 4000 patients with nonvalvular or nonrheumatic AF to [warfarin](#), placebo, or [aspirin](#) and demonstrated that anticoagulation with adjusted-dose warfarin significantly reduces clinical stroke risk when compared to placebo ([figure 1](#)) [1-6]. Overall, adjusted-dose warfarin reduces the risk of stroke by two-thirds compared to no anticoagulant therapy, with the expected degree of absolute benefit dependent on baseline risk ([table 2](#)) [7,8,13].

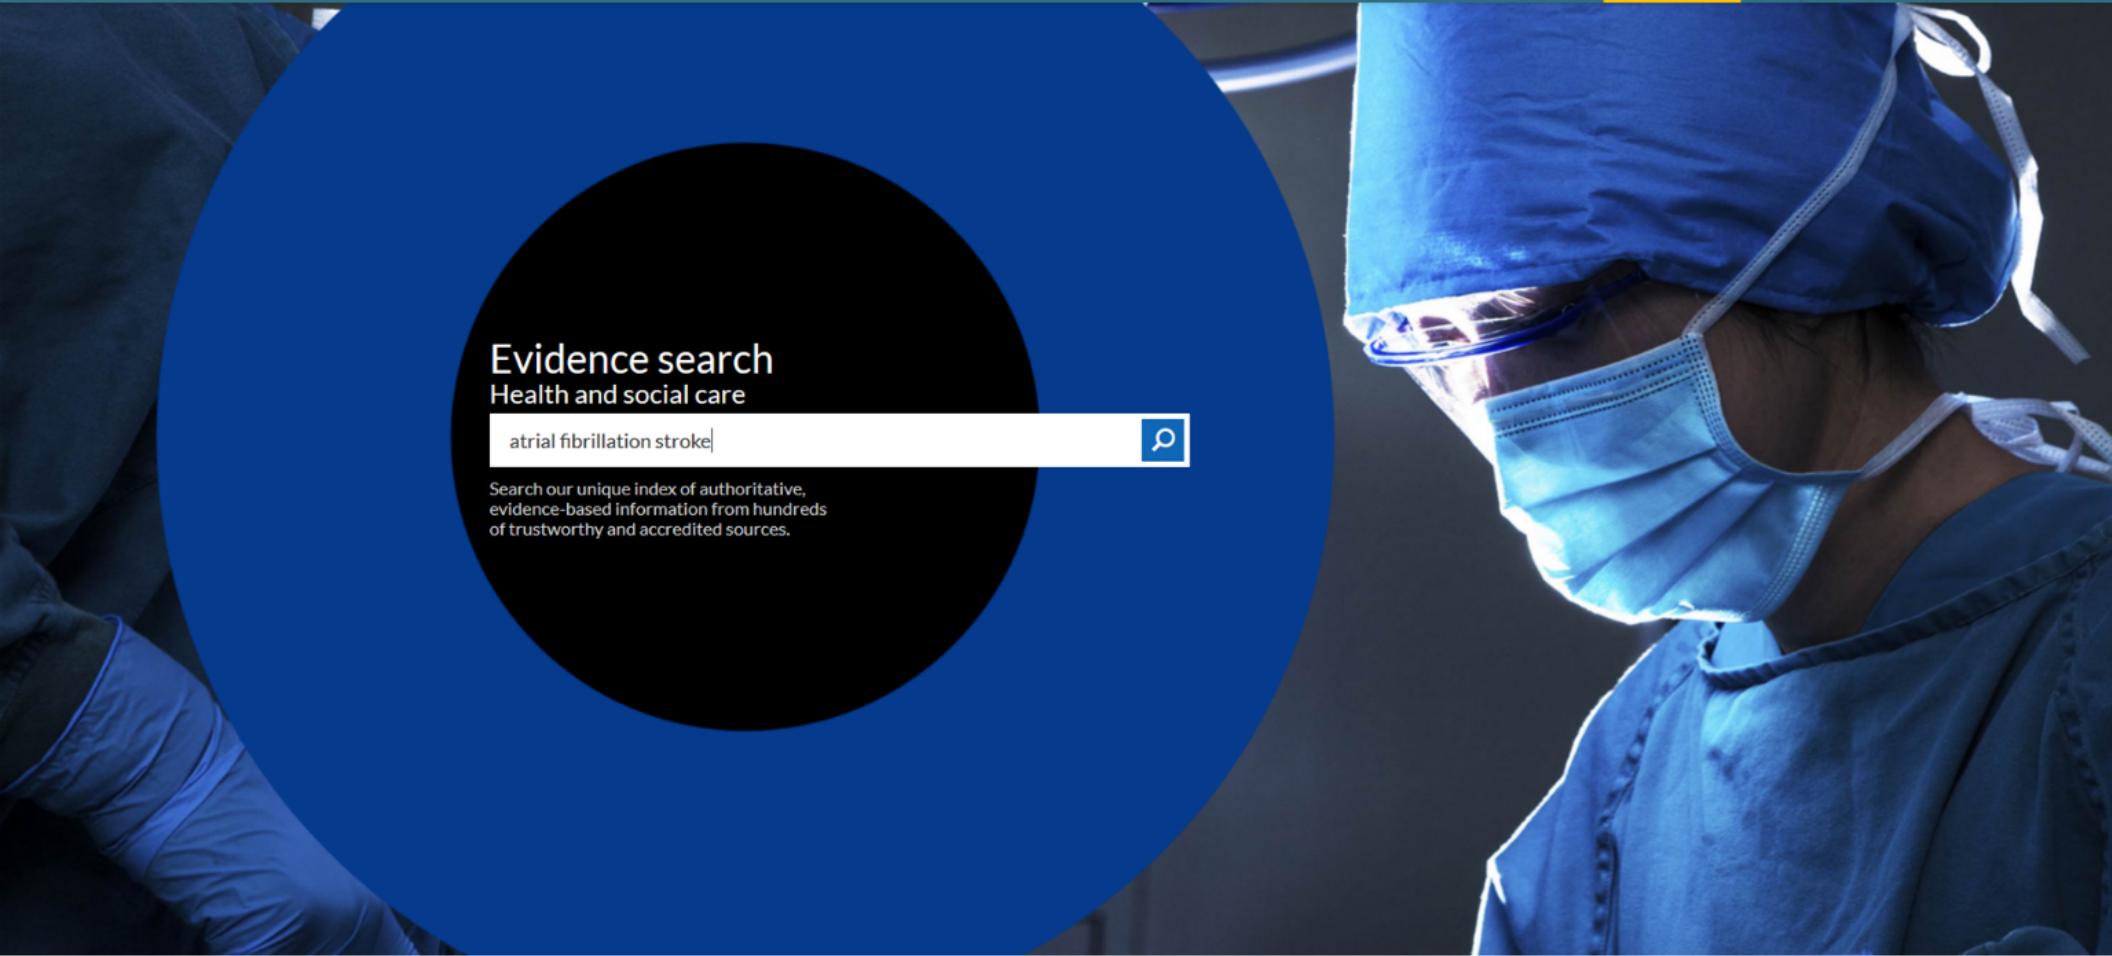

The [warfarin](#) versus placebo or [aspirin](#) trials were conducted in the early 1990s, raising concerns that the findings may not be able to be applied to current practice [14-16]. In an observational study (ATRIA), patients in a community-based, clinical practice cohort who

#### PICO Search

PICO is a novel approach of allowing users to conduct a focussed search based on a structured clinical question [Learn more at cebm.net](#)

There are 4 elements and not all are compulsory, but the more you use the more focussed the results. We use a contingency search to reduce information overload, [click here](#) for further details.

#### Population:

Type of patient eg. diabetics

#### Intervention:

Any intervention eg. treatment, diagnostic test

#### Comparison:

Comparing your intervention with another treatment or test?

#### Outcome:

Outcome interest eg. reduced mortality, fewer exacerbations
