

Figure S5. Proportions of patients enrolled based on positive detection of *MET* exon 14 skipping in liquid and/or tissue biopsy testing. In total, 99 patients enrolled had positive detection of *MET* exon 14 skipping by liquid biopsy, and 88 patients had positive detection of *MET* exon 14 skipping by tissue biopsy. L+/-, positive/negative detection of *MET* exon 14 skipping in liquid biopsy sample; NA, not available (biopsy sample was not taken or was not evaluable/not analyzed); T+/-, positive/negative detection of *MET* exon 14 skipping in tissue biopsy sample. *One patient enrolled in VISION did not have centrally confirmed *MET* exon 14 skipping by liquid or tissue biopsy and is, therefore, not included in L+ or T+ populations; this patient was initially enrolled based on local testing.
